C	B	P(D C,B)	
0	0	0.1	0.9
0	1	0.7	0.3
1	0	0.8	0.2
1	1	0.9	0.1

$$P(S, C, B, X, D) = P(S) P(C|S) P(B|S) P(X|C,S) P(D|C,B)$$

$$P(\text{lung cancer=yes} \mid \text{smoking=no, dyspnoea=yes}) = ?$$

- $P(D=0) = \sum_{S,L,B,X} P(S) \cdot P(C|S) \cdot P(B|S) \cdot P(X|C,S) \cdot P(D|C,B)$
- $\text{MAP/MPE} = \max_{S,L,B,X} P(S) \cdot P(C|S) \cdot P(B|S) \cdot P(X|C,S) \cdot P(D|C,B)$

# Graphical Models

Bayesian networks  
 Markov networks  
 Influence diagram

Primal Graph

A graphical model consists of:

$X = \{X_1, \dots, X_n\}$  -- variables

$D = \{D_1, \dots, D_n\}$  -- domains

$F = \{f_{\alpha_1}, \dots, f_{\alpha_m}\}$  -- (non-negative) functions or “factors”

$$P(S, C, B, X, D) = P(S) P(C|S) P(B|S) P(X|C,S) P(D|C,B)$$

CPD:

C	B	f(D,B,C)

0	1	0.7	0.3
1	0	0.8	0.2
1	1	0.9	0.1

# Types of Queries

- Tasks:

▶ <b>Max-Inference</b> (most likely config.)	$f(\mathbf{x}^*) = \max_{\mathbf{x}} \prod_{\alpha} f_{\alpha}(\mathbf{x}_{\alpha})$
▶ <b>Sum-Inference</b> (data likelihood)	$Z = \sum_{\mathbf{x}} \prod_{\alpha} f_{\alpha}(\mathbf{x}_{\alpha})$
▶ <b>Mixed-Inference</b> (optimal prediction)	$f(\mathbf{x}_M^*) = \max_{\mathbf{x}_M} \sum_{\mathbf{x}_S} \prod_{\alpha} f_{\alpha}(\mathbf{x}_{\alpha})$

- **NP-hard**: exponentially many terms
- We will focus on **approximation** algorithms
  - **Anytime**: very fast & very approximate ! Slower & more accurate

# Why Marginal MAP?

- Often, Marginal MAP is the “right” task:
  - We have a model describing a large system
  - We care about predicting the state of some part

- Complexity:  $\text{NP}^{\text{PP}}$  complete
- Not necessarily easy on trees

- Example: decision making

- Sum over random variables (random effects, etc.)
- Max over decision variables (specify action policies)

Sensor network

Influence diagram:

An Influence diagram

# Marginal Map

▪ Graphical Model:  $\mathcal{M} = \langle \mathbf{X}, \mathbf{D}, \mathbf{F} \rangle$

–variables  $\mathbf{X} = \{X_1, \dots, X_n\}$

–domains  $\mathbf{D} = \{D_1, \dots, D_n\}$

–functions  $\mathbf{F} = \{f_1, \dots, f_r\}$

$$P(\mathbf{X}) = \frac{1}{Z} \prod_j f_j$$

▪ Marginal MAP task:

$$\mathbf{X} = \mathbf{X}_M \cup \mathbf{X}_S$$

$$x_M^* = \operatorname{argmax}_{X_M} \sum_{X_S} \prod_j f_j$$

primal graph

$$\mathbf{X}_M = \{A, B, C, D\}$$

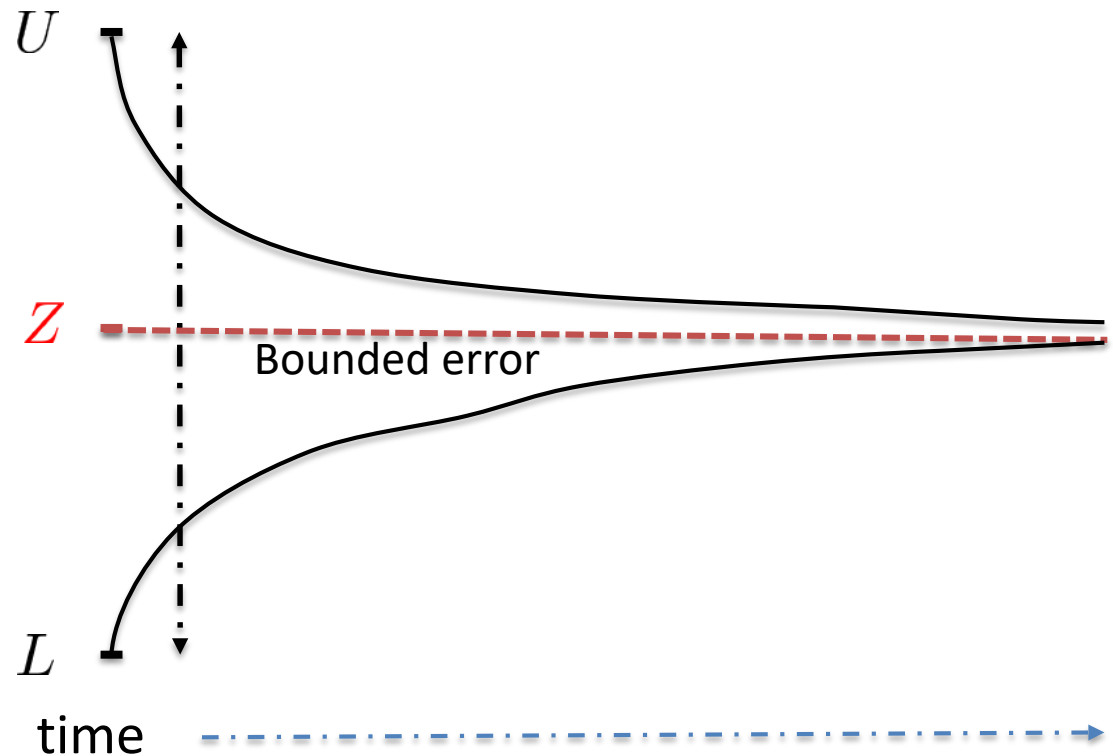

$$\mathbf{X}_S = \{E, F, G, H\}$$

Why is it harder? intuitively

# Goal: Anytime Bounds

- Desiderata
  - Meaningful confidence interval
  - Responsive
  - Complete

# Building Blocks of Approximate Inference

- Three building blocks paradigms
  - Effective at different types of problems

## Variational methods

Reason over small subsets of variables at a time

## (Monte Carlo) Sampling

Use randomization to estimate averages over the state space

## (Heuristic) Search

Structured enumeration over all possible states

# Combining Approaches

# Bucket Elimination

Algorithm *BE-bel* [Dechter 1996]

$$p(A|E = 0) = \alpha \sum_{e,d,c,b} p(A) p(b|A) p(c|A) p(d|A, b) p(e|b, c) \mathbb{1}[e = 0]$$

$\sum_b \prod$  ← Elimination & combination operators

bucket B:

$$p(b|A) p(d|b, A) p(e|b, c)$$

bucket C:

$$p(c|A) \lambda_{B \rightarrow C}(A, d, c, e)$$

bucket D:

$$\lambda_{C \rightarrow D}(A, d, e)$$

bucket E:

$$\mathbb{1}[E = 0] \lambda_{D \rightarrow E}(A, e)$$

bucket A:

$$p(A) \lambda_{E \rightarrow A}(A)$$

$$p(E = 0)$$

$$p(A|E = 0) = p(A, E = 0) / p(E = 0)$$

Elimination & combination operators

$W^* = 4$   
“induced width”  
(max clique size)

# Bucket Elimination

Algorithm *BE-bel* [Dechter 1996]

$$p(A|E = 0) = \alpha \sum_{e,d,c,b} p(A) p(b|A) p(c|A) p(d|A, b) p(e|b, c) \mathbb{1}[e = 0]$$

$\sum_b \prod$  ← Elimination & combination operators

***Time and space exponential in the induced-width / treewidth***

bucket A:

$p(A)$

$\lambda_{E \rightarrow A}(A)$

induced width  
(max clique size)

$p(E = 0)$

$$p(A|E = 0) = p(A, E = 0) / p(E = 0)$$

# Bucket Elimination

Optimization

Algorithm *BE-map* [Dechter 1996]

$$MPE = \max_{a,e,d,c,b} P(a)P(c|a)P(b|a)P(d|a,b)P(e|b,c)$$

$$\max_x \prod \leftarrow \text{Elimination \& combination operators}$$

***Time and space exponential in the induced-width / treewidth***

bucket A:

$p(A)$

$\lambda_{E \rightarrow A}(A)$

induced width  
(max clique size)

OPT

# Why is MMAP Harder for Inference (BE)?

Let's apply Bucket-elimination: Complexity is exponential in the \*constrained\* induced-width

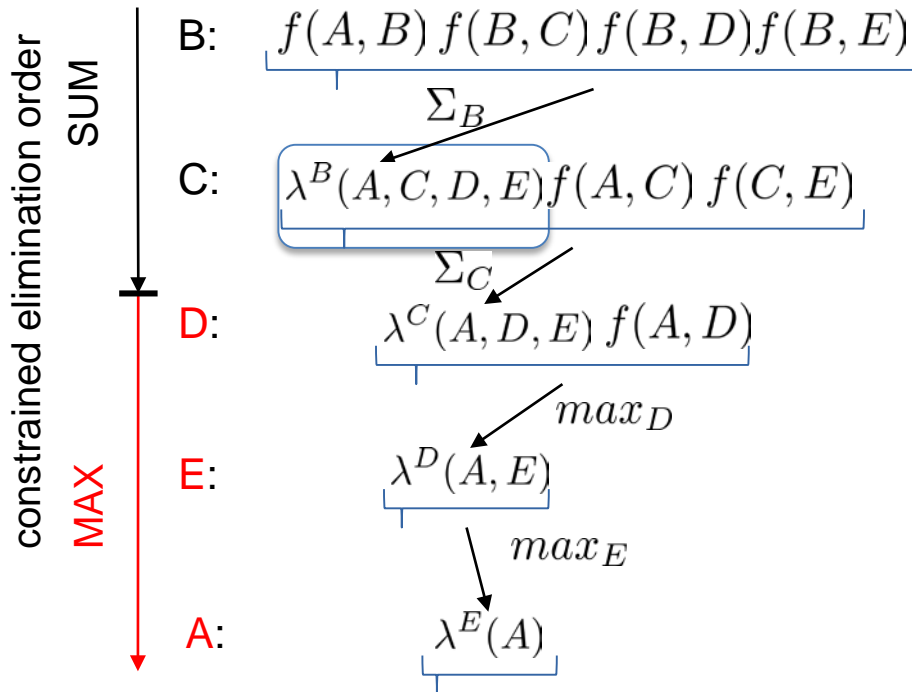

$$\mathbf{X}_M = \{A, D, E\}$$

$$\mathbf{X}_S = \{B, C\}$$

$$\max_{\mathbf{X}_M} \sum_{\mathbf{X}_S} P(\mathbf{X})$$

$$P(\mathbf{X}) = \prod_j f_j$$

MAP\* is the marginal MAP value

# Why is MMAP Harder for Inference (BE)?

$$\mathbf{X}_M = \{A, D, E\}$$

$$\mathbf{X}_S = \{B, C\}$$

**In practice, constrained induced is much larger!**

$$\max_X \sum_Y \phi \leq \sum_Y \max_X \phi$$

(Park & Darwiche, 2003)

(Yuan & Hansen, 2009)

Decomposition-bounds:  
Mini-bucket and weighted Mini-bucket  
Tightening by Cost-shifting

# Mini-Bucket Approximation

For optimization

Split a bucket into mini-buckets  $\rightarrow$  bound complexity

bucket (X) =

$$\left\{ f_1, f_2, \dots, f_r, f_{r+1}, \dots, f_n \right\}$$

$$\lambda_X(\cdot) = \max_x \prod_{i=1}^n f_i(x, \dots)$$

$$\left\{ f_1, \dots, f_r \right\}$$

$$\left\{ f_{r+1}, \dots, f_n \right\}$$

$$\lambda_{X,1}(\cdot) = \max_x \prod_{i=1}^r f_i(x, \dots)$$

$$\lambda_{X,2}(\cdot) = \max_x \prod_{i=r+1}^n f_i(x, \dots)$$

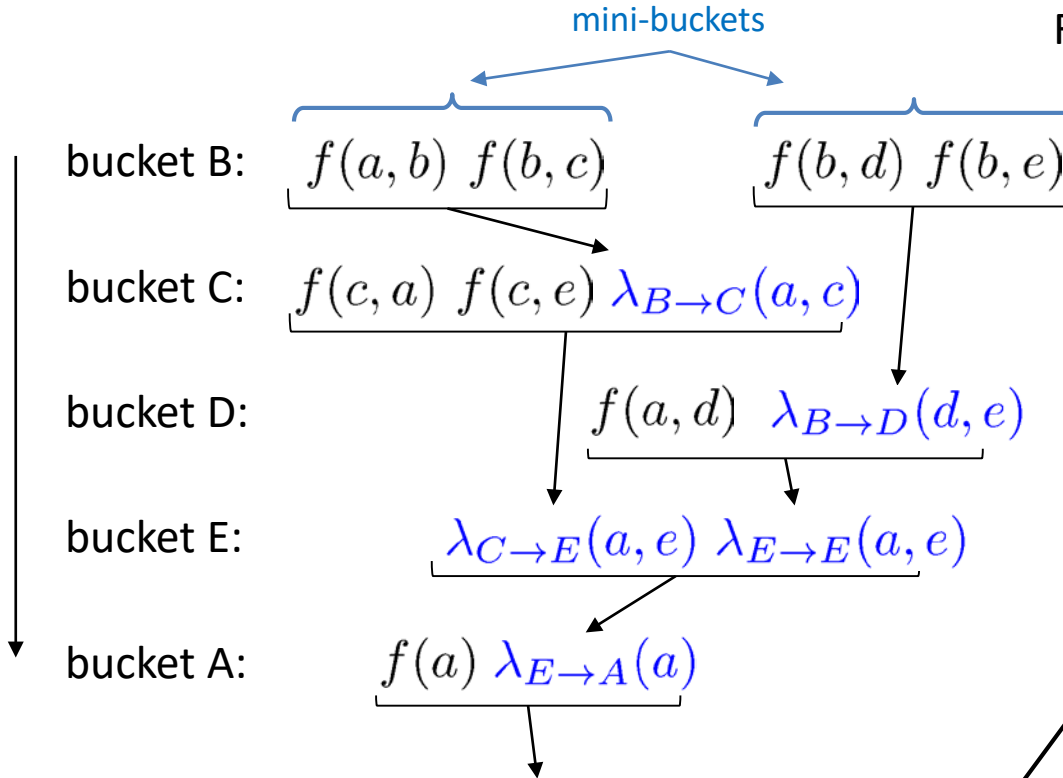

$$\lambda_X(\cdot) \leq \lambda_{X,1}(\cdot) \lambda_{X,2}(\cdot)$$

Exponential complexity decrease:  $O(e^n) \rightarrow O(e^r) + O(e^{n-r})$

# Mini-Bucket Elimination

[Dechter & Rish 2003]

For optimization

**U = upper bound**

$$\lambda_{B \rightarrow C}(a, c) = \max_b f(a, b) f(b, c)$$

$$\lambda_{B \rightarrow D}(d, e) = \max_b f(b, d) f(b, e)$$

$$\lambda_{C \rightarrow E}(a, e) = \max_c \dots$$

# Mini-Bucket Decoding

$$\begin{aligned}
 \mathbf{b}^* &= \arg \max_b f(a^*, b) \cdot f(b, c^*) \\
 &\quad \cdot f(b, d^*) \cdot f(b, e^*) \\
 \mathbf{c}^* &= \arg \max_c f(c, a^*) \cdot f(c, e^*) \cdot \lambda_{B \rightarrow C}(a^*, c) \\
 \mathbf{d}^* &= \arg \max_d f(a^*, d) \cdot \lambda_{B \rightarrow D}(d, e^*) \\
 \mathbf{e}^* &= \arg \max_e \lambda_{C \rightarrow E}(a^*, e) \cdot \lambda_{D \rightarrow E}(a^*, e) \\
 \mathbf{a}^* &= \arg \max_a f(a) \cdot \lambda_{E \rightarrow A}(a)
 \end{aligned}$$

**Greedy configuration = lower bound**

For optimization

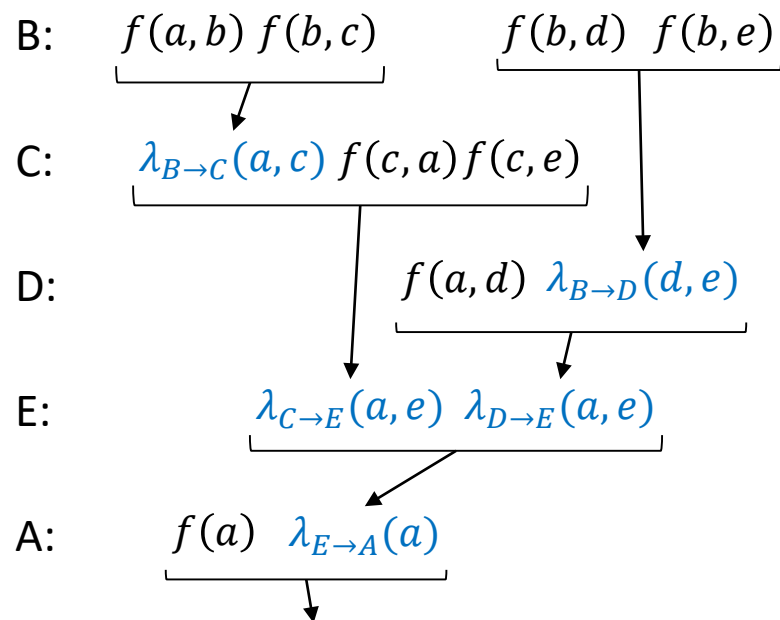

**U = upper bound**

# Bucket and Mini-Bucket Elimination

- **Input:**  $l$  – max number of variables allowed in a mini-bucket
- **Output:** [Lower bound (P of suboptimal solution), upper bound]

Example: **MBE-mpe(3)**

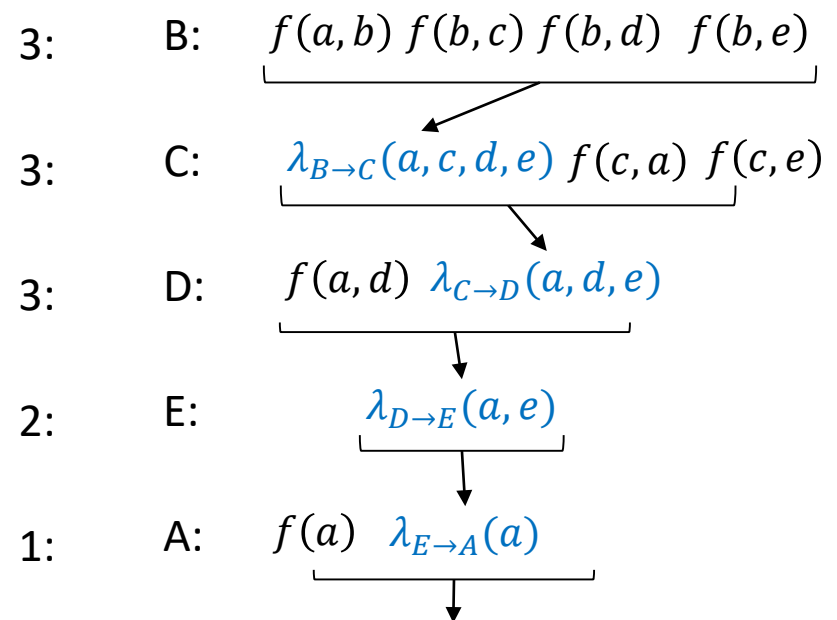

**U = upper bound**

$w^* = 2$

versus

max variables  
in a mini-bucket

**BE-mpe**

**OPT**

$w^* = 4$

[Dechter and Rish, 1997]

# Properties of Mini-Bucket Elimination

(For optimization)

- Bounding from above and below

Consistent solutions ( **greedy search** )

- Complexity:  $O(r \exp(i))$  time and  $O(\exp(i))$  space.
- Accuracy: determined by Upper/Lower bound.
- As  $i$  increases, both accuracy and complexity increase.
- Possible use of mini-bucket approximations:
  - As anytime algorithms
  - As heuristics in search

# Tightening the Bound

Add factors that “adjust” each local term, but cancel out in total

Reparameterization:  
 $\forall j : \sum_{\alpha \ni j} \lambda_{j \rightarrow \alpha}(x_j) = 0$

$$\log f(\mathbf{x}^*) = \max_{\mathbf{x}} \sum_{\alpha} \theta_{\alpha}(\mathbf{x}_{\alpha}) \leq \min_{\{\lambda_{i \rightarrow \alpha}\}} \sum_{\alpha} \max_{\mathbf{x}_{\alpha}} \left[ \theta_{\alpha}(\mathbf{x}_{\alpha}) + \sum_{i \in \alpha} \lambda_{i \rightarrow \alpha}(x_i) \right]$$

- Bound solution using decomposed optimization
  - Solve independently: optimistic bound
- Tighten the bound by re-parameterization
  - Enforces lost equality constraints using Lagrange multipliers

# Tightening the Bound

Add factors that “adjust” each local term, but cancel out in total

Reparameterization:

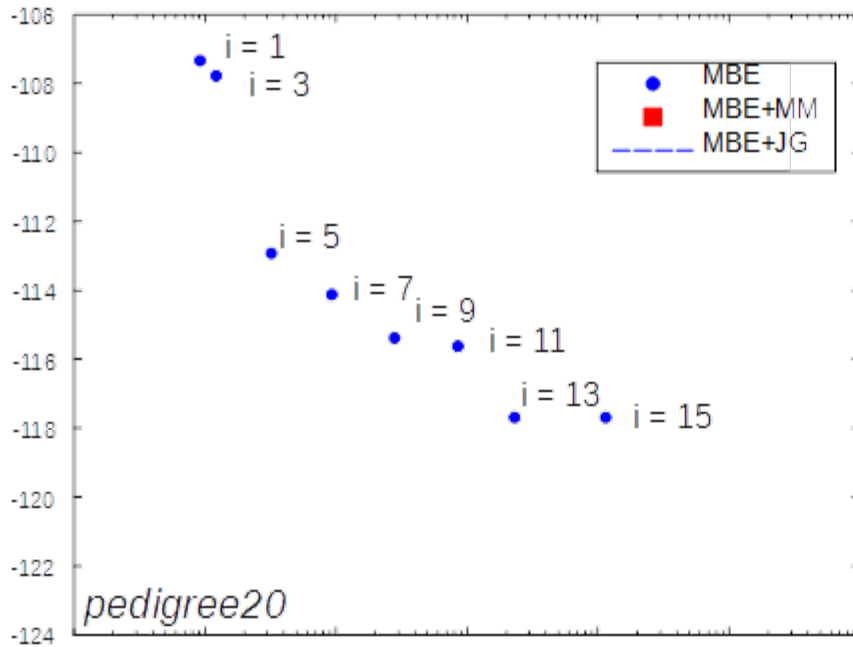

$$\forall j : \sum_{\alpha \ni j} \lambda_{j \rightarrow \alpha}(x_j) = 0$$

$$\log f(\mathbf{x}^*) = \max_{\mathbf{x}} \sum_{\alpha} \theta_{\alpha}(\mathbf{x}_{\alpha}) \leq \min_{\{\lambda_{i \rightarrow \alpha}\}} \sum_{\alpha} \max_{\mathbf{x}_{\alpha}} \left[ \theta_{\alpha}(\mathbf{x}_{\alpha}) + \sum_{i \in \alpha} \lambda_{i \rightarrow \alpha}(x_i) \right]$$

- Many names for the same class of bounds

- Dual decomposition [Komodakis et al. 2007]
- TRW, MPLP [Wainwright et al. 2005; Globerson & Jaakkola 2007]
- Soft arc consistency [Cooper & Schiex 2004]
- Max-sum diffusion [Warner 2007]

# Anytime Approximation

- Can tighten the bound in various ways
  - Cost-shifting (improve consistency between cliques)
  - Increase  $i$ -bound (higher order consistency)
- Simple moment-matching step improves bound significantly

# Anytime Approximation

- Can tighten the bound in various ways
  - Cost-shifting (improve consistency between cliques)
  - Increase i-bound (higher order consistency)
- Simple moment-matching step improves bound significantly

# Anytime Approximation

- Can tighten the bound in various ways
  - Cost-shifting (improve consistency between cliques)
  - Increase  $i$ -bound (higher order consistency)
- Simple moment-matching step improves bound significantly

# WMB for Marginal MAP

$$\sum_x f_1(x) \cdot f_2(x) \leq \left[ \sum_x f_1(x)^{\frac{1}{w_1}} \right]^{w_1} \cdot \left[ \sum_x f_2(x)^{\frac{1}{w_2}} \right]^{w_2}$$

Holder Inequality

$$(w_1 + w_2 = 1)$$

$$\lambda_{B \rightarrow C}(a, c) = \sum_b^{w_1} f(a, b) f(b, c)$$

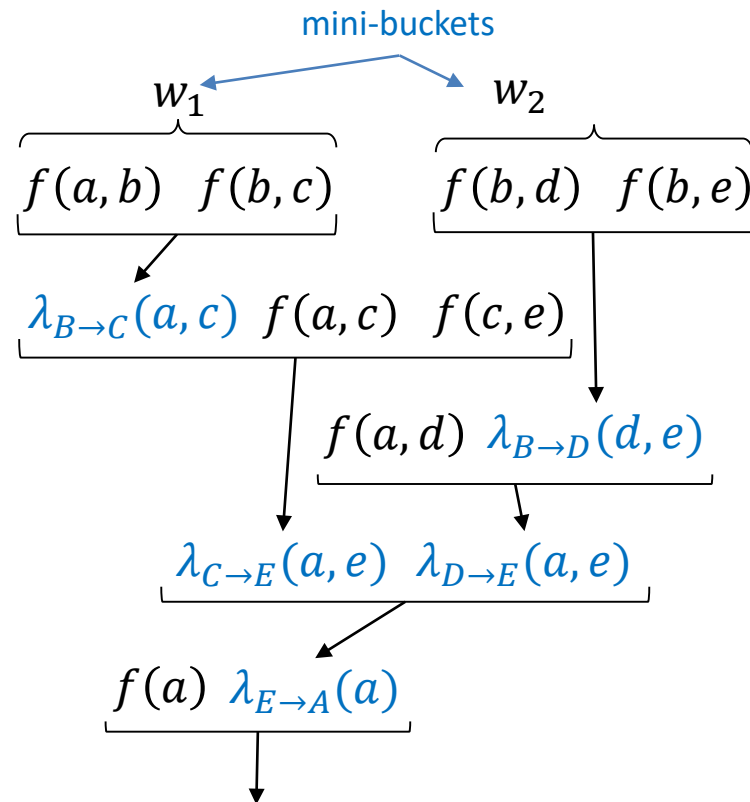

$$\lambda_{B \rightarrow D}(d, e) = \sum_b^{w_2} f(b, d) f(b, e)$$

⋮

$$\lambda_{E \rightarrow A}(a) = \max_e \lambda_{C \rightarrow E}(a, e) \lambda_{D \rightarrow E}(a, e)$$

$$U = \max_a f(a) \lambda_{E \rightarrow A}(a)$$

Marginal MAP

***U = upper bound***

Can optimize over cost-shifting and weights  
(single pass “MM” or iterative message passing)

# Bucket Elimination (BE) and WMB

[Dechter 1999, Ihler et. Al. 2013]

Holder inequality facilitated weighted MB for summation

- Bounding from above and below

Consistent solutions ( greedy search)

Pros:

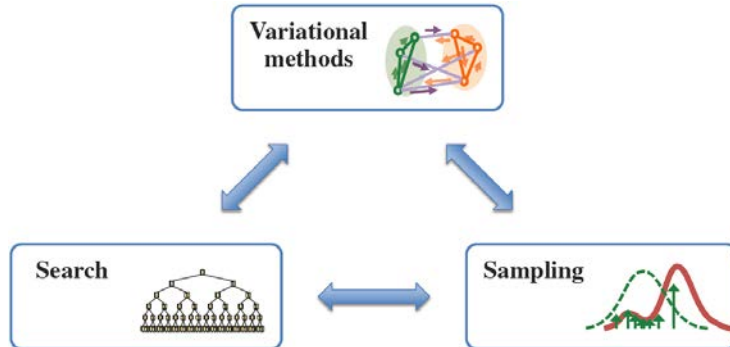

- Computationally bounded
- Gives upper or lower bound
- Cost-shifting Message passing
- improves bound

Cons:

- Not anytime!
- not asymp. tight w/o more memory

# Outline

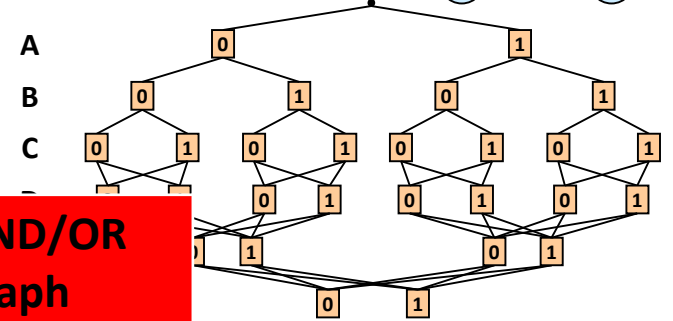

- Graphical models: definition, examples, methodology

# Search Aided by Variational Heuristics

[Kask, Dechter, AIJ 2001]

Given a partial assignment,  $[\hat{a} = 1, \hat{e} = 0]$   
 (weighted) mini-bucket gives an admissible heuristic:

“cost to go”:

$$\tilde{h}(\hat{a}, \hat{e}, D) = \lambda_{C \rightarrow E}(\hat{a}, \hat{e}) + f(\hat{a}, D) + \lambda_{B \rightarrow D}(D, \hat{e})$$

“cost so far”:

$$g(\hat{a}, \hat{e}, D) = f(A = \hat{a})$$

For MAP, marginal map and partition function

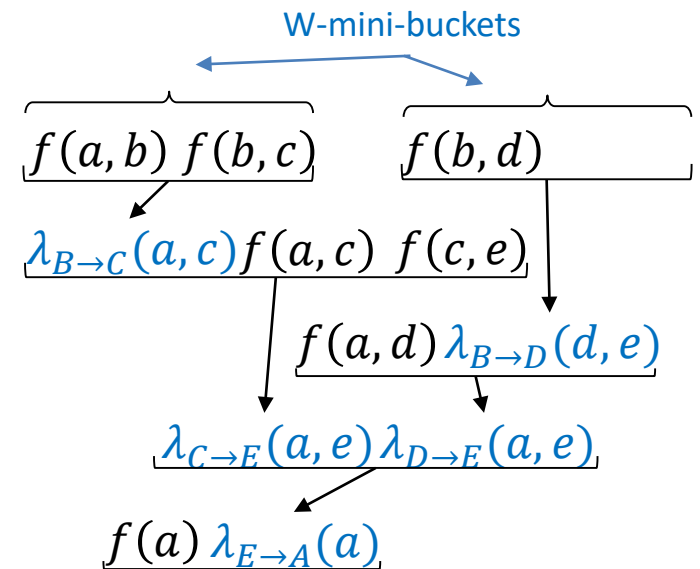

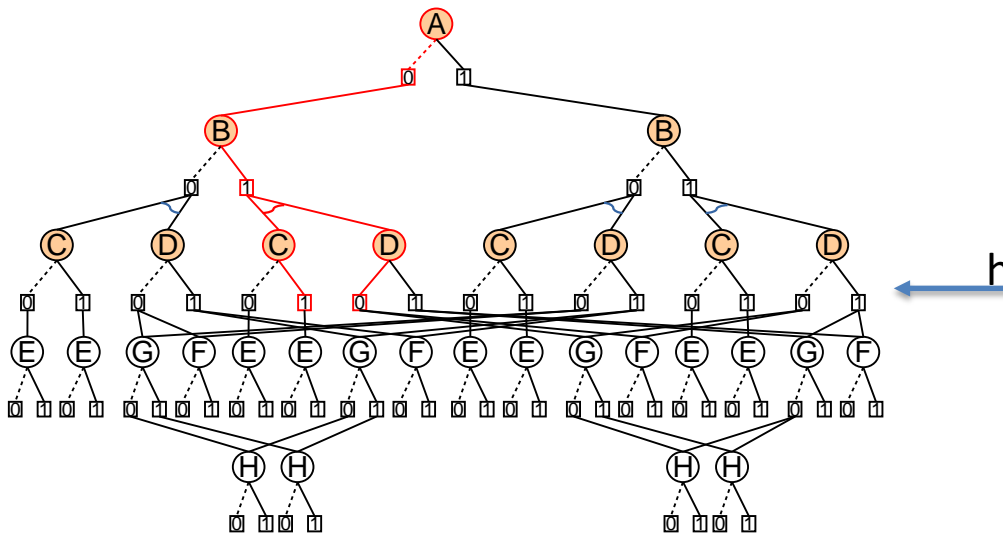

# AND/OR Search for Marginal MAP

constrained pseudo tree

primal graph

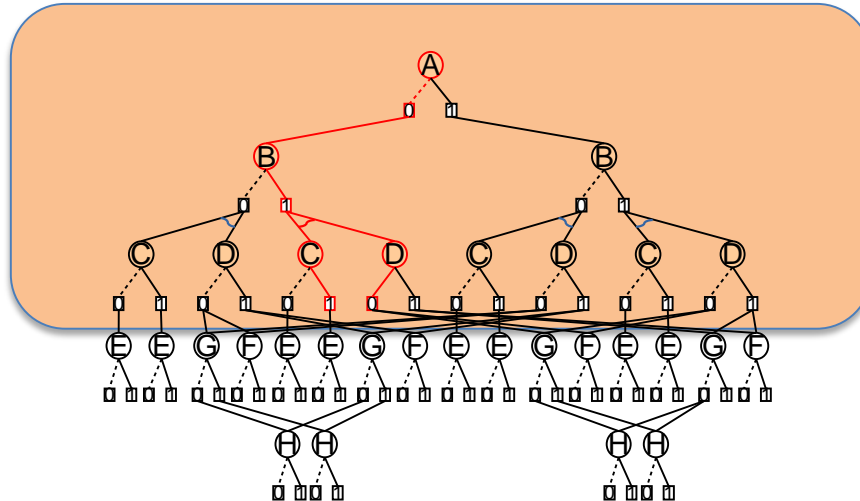

# Exact MMAP Solvers: Best or Depth-First Search?

[Marinescu, Dechter, Ihler, AAI 2014]

Depth-First search

Best-First search

The MAP search space

**Best-first search is superior**  
**Expanding fewer full MAP**  
**Solutions, thus less**  
**conditional sums**

# Anytime Solvers for Marginal MAP

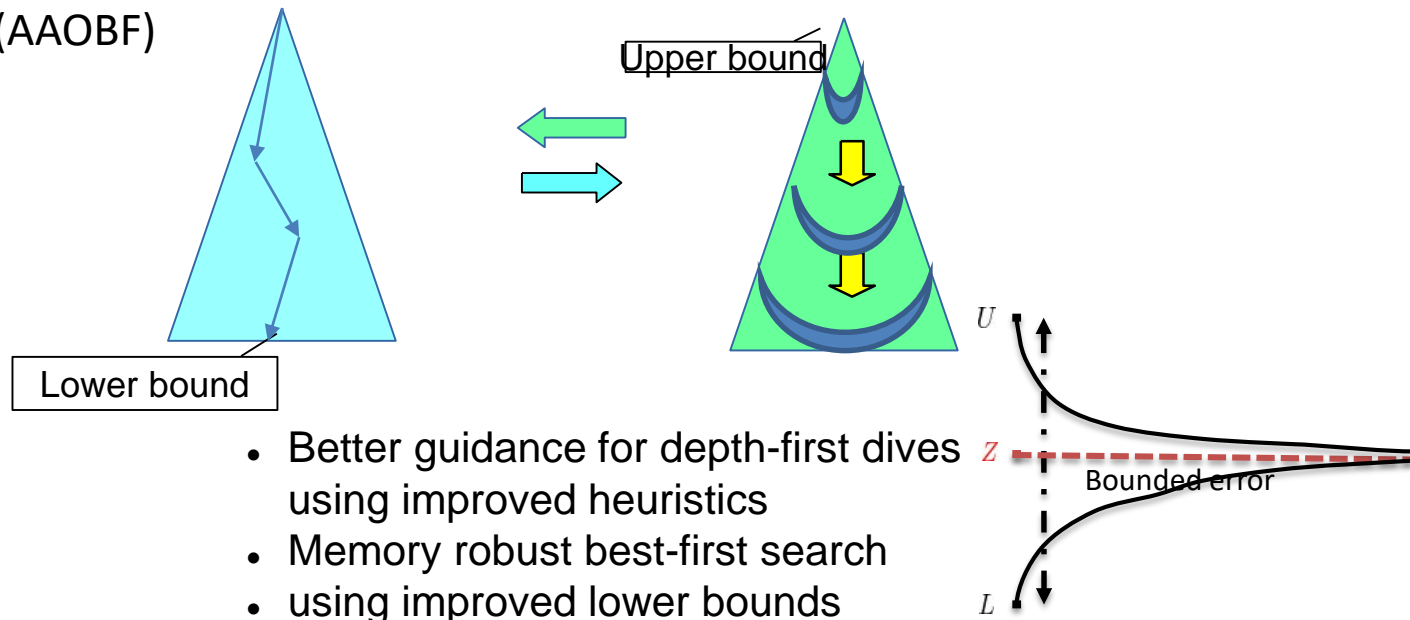

[Marinsecu, Lee, Dechter, Ihler, AAI-2017, JAIR 2019]

- **Weighted Best-First search:**

- Weighted Restarting AOBF (WAOBF)
- Weighted Restarting RBFAOO (WRBFAOO)
- Weighted Repairing AOBF (WRAOBF)

- **Interleaving Best-first and depth-first search:**

- Look-ahead (LAOBF),
- alternating (AAOBF)

- **Weighted A\* search** [Pohl 1970]

- non-admissible heuristic
- Evaluation function:

$$f(n)=g(n)+w \cdot h(n)$$

- **Guaranteed w-optimal solution, cost  $C \leq w \cdot C^*$**

# LAOBF (Best-first AND/OR Search with Depth-First lookaheads)

Best-first selection

Depth-first lookahead

- depth-first dive at the tip of  $T_b$
- compute global lower bound
- cache summation subproblems

Best-first expansion & update

- Select a tip node  $n$
- Expand and Update  $n$

Cutoff parameter: perform depth-first dive at every  $\theta$  number of node expansions.  
 best partial solution tree:  $T_b$

# AAOBF (Alternating Best-First and Depth-First)

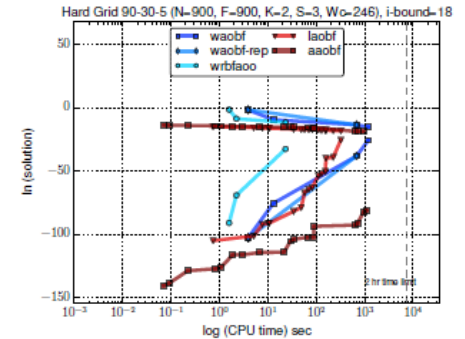

# Benchmarks and Evaluation Methods

Benchmark		#. inst	$n$	$k$	$w_c$	$h_c$	$w_u$	$h_u$
<i>grid</i>	easy	15	144 – 1156	2 – 2	16 – 52	50 – 164	15 – 49	48 – 198
	hard	60	144 – 1156	2 – 2	25 – 375	42 – 421	–	–
<i>pedigree</i>	easy	10	334 – 1289	4 – 7	35 – 237	51 – 134	15 – 29	60 – 160
	hard	40	334 – 1289	4 – 7	35 – 237	63 – 259	–	–
<i>promedas</i>	easy	10	453 – 1849	2 – 2	10 – 122	42 – 174	10 – 106	43 – 157
	hard	40	453 – 1849	2 – 2	11 – 490	36 – 507	–	–

Table 1: Benchmark instances. #. inst is the number of instances in each domain. We also distinguish easy and hard instances. The minimum and the maximum values from the set of problems are shown in the following parameters:  $n$  is the number of variables,  $k$  is the maximum domain size,  $w_c$  is the constrained induced width,  $h_c$  is the height of the pseudo tree corresponding to the constrained elimination ordering. The unconstrained induced width,  $w_u$  and pseudo tree height,  $h_u$  are also shown to highlight the difficulty of hard Marginal MAP problem instances.

# Anytime Bounds of Marginal MAP

- Search: LAOBF, AAOBF, BRAOBB, WAOBF, WAOBF-rep
- heuristic: WMB-MM (20)
- memory: 24 GB
- Anytime lower and upper bounds from hard problem instances with **i-bound 12 (left) and 18 (right)**.
- The horizontal axis is the CPU time in log scale and the vertical axis is the value of marginal MAP in log scale.
- Benchmarks: Pedigrees, promedas, grids, planning. A fraction of variables selected as MAP (10% hard instances).

# Anytime Bounds of Marginal MAP

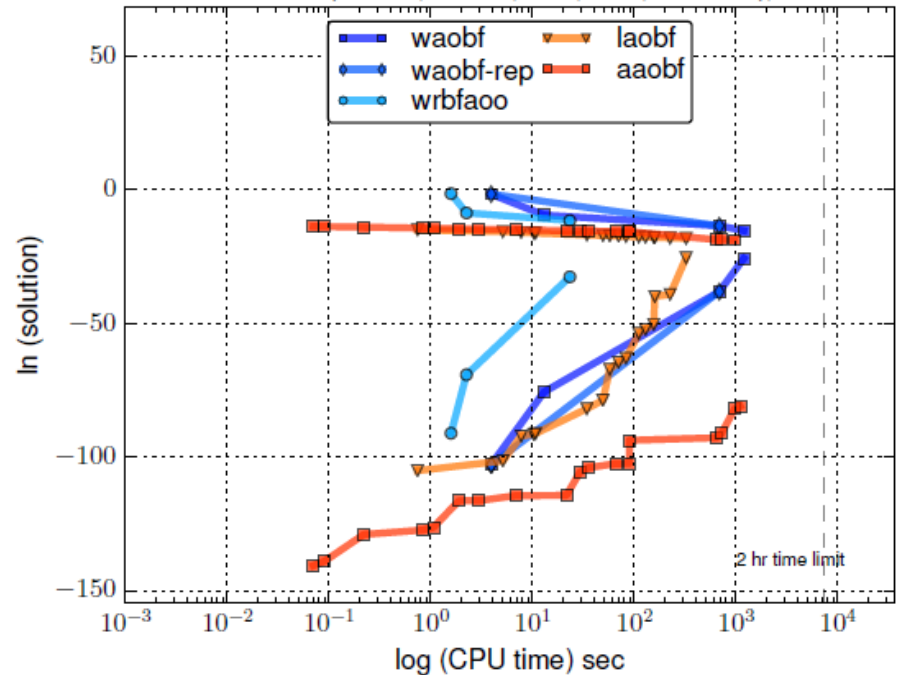

i-bound = 12

Hard Grid 90-30-5 (N=900, F=900, K=2, S=3, Wc=246), i-bound=12

i-bound = 18

Hard Grid 90-30-5 (N=900, F=900, K=2, S=3, Wc=246), i-bound=18

# Average Gap Quality

But, schemes are limited to tractable conditioned-summation

# Outline

- Graphical models, The Marginal Map task
- Inference and variational bounds
- AND/OR search spaces
- Combining methods: Heuristic Search for Marginal Map
- **Combining methods: Sampling**
- Conclusion

# Importance Sampling

- Basic empirical estimate of probability:

$$\mathbb{E}[u(x)] = \int p(x)u(x) \approx \hat{u} = \frac{1}{m} \sum_i u(\tilde{x}^{(i)}) \quad \tilde{x}^{(i)} \sim p(x)$$

- Importance sampling:

$$\int p(x)u(x) = \int q(x) \frac{p(x)}{q(x)} u(x) \approx \frac{1}{m} \sum_i \frac{p(\tilde{x}^{(i)})}{q(\tilde{x}^{(i)})} u(\tilde{x}^{(i)}) \quad \tilde{x}^{(i)} \sim q(x)$$

Importance weights

# Choosing a Proposal- WMB-IS

[Liu, Fisher, Ihler 2015]

$$\Pr[|\hat{Z} - Z| > \epsilon] \leq 1 - \delta \quad \epsilon = \sqrt{\frac{2\hat{V} \log(4/\delta)}{m}} + \frac{7U \log(4/\delta)}{3(m-1)}$$

- Can use WMB upper bound to define a proposal  $q_{\text{wmb}}(x)$

$$\tilde{\mathbf{b}} \sim w_1 q_1(b|\tilde{a}, \tilde{c}) + w_2 q_2(b|\tilde{d}, \tilde{e})$$

## Weighted mixture:

use minibucket 1 with probability  $w_1$   
or, minibucket 2 with probability  $w_2 = 1 - w_1$

where

$$q_1(b|a, c) = \left[ \frac{f(a, b) \cdot f(b, c)}{\lambda_{B \rightarrow C}(a, c)} \right]^{\frac{1}{w_1}}$$

⋮

$$\tilde{\mathbf{a}} \sim q(A) = f(a) \cdot \lambda_{E \rightarrow A}(a)/U$$

**Key insight: provides bounded importance weights!**

**$U =$  upper bound**

$$0 \leq f(x)/q_{\text{wmb}}(x) \leq U \quad \forall x$$

# Probabilistic Lower Bounds for MMAP

ANYSBFS: Anytime Stochastic Best-First Search

WMB-IS [Liu et. Al. 2015]

[Marinsecu, Dechter, Ihler Ijcai 2018]

Compute a (probabilistic) lower bound on the conditioned sum subproblem

$$Pr(\hat{Z} - \Delta(n, \delta) \leq Z) \geq (1 - \delta)$$

WMB based importance sampling scheme:

$n$  - number of samples

$\delta$  - confidence value

$Z_{wmb}$  - result of WMB

$\hat{Z}$  - Importance Sampling estimate

$$\Delta(n, \delta) = \sqrt{\frac{2\hat{v}ar(w(x)) \log(2/\delta)}{n}} + \frac{7Z_{wmb} \log(2/\delta)}{3(n-1)}$$

**Solving the conditioned SUM subproblem is hard!**

$\#P$  - complete

# Stochastic Anytime Search for MMAP (Grids)

[Marinescu, Ihler, Dechter IJCAI-2018, Lou, Dechter, Ihler AAAI-2018]

ANYSBFS: Anytime Stochastic Best-First Search

ANYLDFS: Anytime Learning Depth-First Search

$$acc_{lb} = \frac{|l_t - l^*|}{l^*}$$

$l_t$  – lower bound at time  $t$

$l^*$  – tightest lower bound found

Average over 150 instances

$$acc_{ub} = \frac{|u_t - u^*|}{u^*}$$

$u_t$  – upper bound at time  $t$

$u^*$  – tightest upper bound found

Average over 150 instances

(Lower plots are better)

# Stochastic Anytime Search for MMAP (Planning)

# Summary

**Inference,  
Variational  
methods**

Bucket-elimination  
weighted mini-bucket (WMB)

[Dechter 1999, Dechter and Rish, 2003  
Liu and Ihler, ICML 2011]

provide  
heuristic

provide WMB-IS  
proposal [Liu et al., NIPS 2015]

**Search**

AND/OR search (AODFS)

[Marinescu et al 2009, Lou et al., AAAI 2017]

Marinescu et al., IJCAI 2018]

refine proposal

help search

**Sampling**

dynamic importance sampling (DIS)

[Lou et al., NIPS 2017]

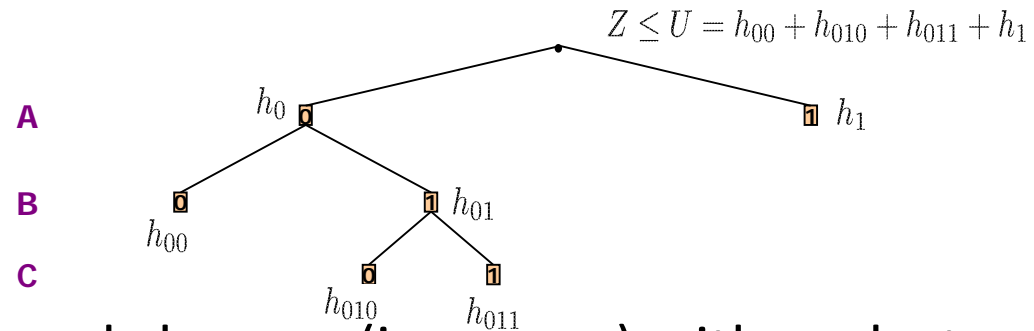

# Dynamic Importance Sampling

(For partition function)

[Lou, Dechter, Ihler, NIPS 2017, AAAI 2019]

- Interleave

- Building search tree (expand Nd nodes) (For partition function)
- Draw samples given search bound (NI samples)

- Key insight: proposal changes (improves) with each step
  - Use weighted average: better samples get more weight

$$\hat{Z} = \frac{\text{HM}(\mathbf{U})}{N} \sum_{i=1}^N \frac{\hat{Z}_i}{U_i}, \quad \text{HM}(\mathbf{U}) = \left[ \frac{1}{N} \sum_{i=1}^N \frac{1}{U_i} \right]^{-1}$$

- Derive corresponding concentration bound on Z

# Aggregated Results

[Lou, Dechter, Ihler, NIPS 2017, AAAI 2019]

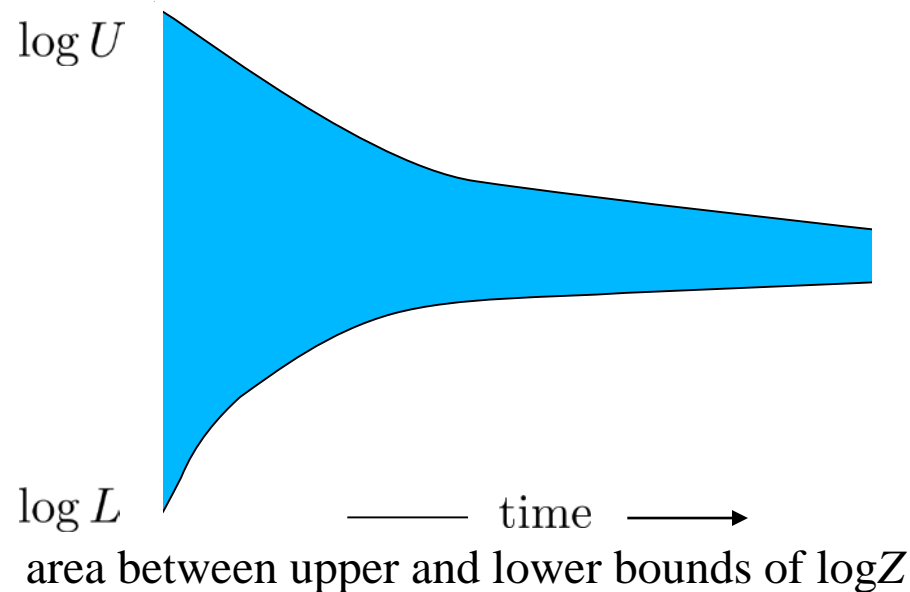

Table 1: Mean area between upper and lower bounds of  $\log Z$ , normalized by WMB-IS, for each benchmark. Smaller numbers indicate better anytime bounds. The best for each benchmark is bolded.

	AOBFS	WMB-IS	DIS ( $N_l=1, N_d=1$ )	DIS ( $N_l=1, N_d=10$ )	two-stage
pedigree	16.638	1	0.711	<b>0.585</b>	1.321
protein	1.576	1	0.110	<b>0.095</b>	2.511
BN	0.233	1	0.340	<b>0.162</b>	0.865

[pyGM](#) : Python Toolbox for Graphical Models by Alexander Iher.

# Continuing Work

- Combining approaches:
  - Tune the hyper-parameters automatically
  - Extend to decision networks
- Languages and Tools:
  - Relational languages
  - Handle constraints specification and continuous functions
  - Temporal domains; Planning, e.g., Influence diagrams, MDPs, POMDPs
  - Cross interaction of deep learning and graphical models → Reinforcement
